The global Bioleaching market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Bioleaching is a biotechnological process used to extract valuable metals from ores and waste materials through the action of microorganisms. It involves the use of bacteria or other microbes that oxidize and solubilize metal compounds, making them easier to recover. The process is commonly applied in mining to extract metals such as copper, gold, and zinc from low-grade ores or tailings. Bioleaching offers several advantages, including lower environmental impact compared to traditional methods and the ability to process ores that are otherwise economically unfeasible. It leverages the natural metabolic activities of microorganisms to facilitate the leaching of metals, thus providing a sustainable and eco-friendly alternative to conventional extraction techniques.

United States market for Bioleaching is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
