Medical adhesives refer to medical materials that can be polymerized in the body to quickly bond between tissues or between tissues and non-tissues, and can play a certain role in hemostasis and sealing. According to different material properties, it can be divided into biological adhesives (such as fibrin derivatives, mussel adhesion proteins, gelatin, etc.) and chemical adhesives (such as cyanoacrylates, polyethylene glycols, Polyurethanes, etc.). Because chemical adhesives often have shortcomings such as poor elasticity of bonding sites, foreign body reaction to living tissues, and potential chemical toxicity, most of the natural biomass materials have good biocompatibility and low immunogenicity.
