Bioaerosols mainly refer to the suspension system formed by various biomass particles in the air, including bacteria, fungi, viruses and other microbial particles and active particles (pollen, spores, etc.) as well as various plasmids released into the air by living organisms. Bioaerosol is an important component of atmospheric aerosol, which has potential important effects on human health, atmospheric environment, ecosystem and climate change. Bioaerosols have potentially important effects on human health. Airborne bacteria, fungi, viruses and other organisms aerosol particles widely consist in the bottom layer of the atmosphere, and can and propagation in the atmosphere, causing

the human respiratory tract infection, asthma, skin allergies, asthma, chronic lung disease and urgent chronic diseases such as cardiovascular disease, and animal and plant disease, serious threat to human health and affect air quality. Biological aerosol real-time online monitoring system can monitor and analyze the air quality of public places, indoor and ambient air, and can give early warning of harmful biological aerosol. It is an important equipment for discovering and disposing biological pollution. Its main application fields include airport, subway, port inspection and quarantine, aseptic workshop monitoring, security of important departments and major events, anti-biological terrorist attacks, biological weapon early warning, etc. In the future, with the development of technology and the improvement of requirements of downstream customers for the real-time online monitoring system of biological aerosol, the real-time online monitoring system of biological aerosol will have greater development potential.
