Abstracts

The global Biological Small-Caliber Artificial Blood Vessel market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Bio-type small-caliber artificial blood vessels are medical devices made of biomaterials and used to replace or repair blood vessels with smaller diameters (usually less than 6 mm in diameter). These blood vessels are made of natural biomaterials or decellularized animal tissues, which can integrate well with human tissues, reduce immune rejection, and promote the regeneration and repair of new blood vessels. Bio-type small-caliber artificial blood vessels are widely used in the fields of cardiovascular disease treatment and vascular injury repair, providing higher biocompatibility and long-term functionality.

Biological small-caliber artificial blood vessels represent a major advancement in the field of cardiovascular disease and vascular injury repair. By using natural biomaterials or decellularized animal tissues, these blood vessels can significantly improve compatibility with human tissues, reduce immune rejection, and promote the migration and regeneration of their own cells. Compared with traditional synthetic blood vessels, biological small-caliber artificial blood vessels are not only closer to natural blood vessels in function, but also reduce the incidence of complications and provide a longer service life. Therefore, biological small-caliber artificial blood vessels have a very broad prospect in clinical applications, especially in meeting the needs of small-diameter blood vessel replacement, showing excellent potential and effect.
