Biomass is currently widely used as a fuel, but the biomass should be dried before use. Through the drying process, a large amount of water can be removed from the biomass. The reduced weight of biomass helps reduce processing costs as well as storage and transportation costs. Raw materials such as Sawdust and Bamboo Dust enter the Biomass Dryer and are dried by hot air, steam or hot water. Biomass Dryer typically includes heat generating units, drying units and air pollution control units.

The global Biomass Dryer market size is projected to grow from US\$ 494 million in 2023 to US\$ 780 million in 2030; it is expected to grow at a CAGR of 6.7% from 2024 to 2030.

LP Information, Inc. The downstream application of biomass dryer is the biomass energy industry. In the overall energy supply, fossil fuels such as coal, oil and natural gas still dominate in most countries. For example most Asian countries, Australia and South Africa. Over the past decade, the share of renewable energy in global energy consumption has increased year by year. Biomass accounts for more than half of renewable energy supply in most countries, with the exception of countries with relatively high hydropower resources. Biomass energy supply in Brazil and Finland has accounted for more than 30% of the total energy supply.

This report presents a comprehensive overview, market shares, and growth opportunities of Biomass Dryer market by product type, application, key manufacturers and key regions and countries.
