The global Biomass Hot Blast Stove market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Biomass hot blast stove is a hot blast stove that uses biomass pellets as fuel. After the biomass fuel is burned, high-temperature flue gas is produced. The high-temperature flue gas is brought to the heat exchange section through the induced draft fan. After the heat exchange, clean, constant temperature and constant pressure hot air is generated and sent to the heating equipment through pipelines. According to different working principles, biomass hot blast stoves can be divided into direct-fired hot blast stoves and indirect heat exchange hot blast stoves. Compared with other hot blast stoves, it has the advantages of good combustion effect, high thermal efficiency, green environmental protection and no pollution, low carbon emissions, and good energy saving effect.
