Biomass plastic is a polymeric material chemically or biologically synthesized from renewable biomass resources. In other words, the raw material of biomass plastic is plant material that grows through photosynthesis using carbon dioxide.

Therefore, even if biomass plastics are incinerated and emit carbon dioxide, the total amount of carbon dioxide absorbed during growth and the total amount of carbon dioxide emitted during incineration is plus or minus zero, making them highly carbon neutral. Biomass plastics can be biodegradable or non-biodegradable.

Although not necessarily biodegradable, they are known as environmentally friendly plastics due to their carbon neutrality. Since there are various raw materials, chemical structures, manufacturing methods, and functions, it is important to understand the characteristics of each material before using the appropriate one.

The global Biomass Plastic market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
