The Biomechanics Tracking Solution is a technological approach integrating sensors, data acquisition, and analysis systems, designed for precise and quantitative dynamic and kinematic measurements of human movement. Its core lies not only in capturing the position and posture of bones and joints but also in the real-time measurement and calculation of deep physical parameters generated during movement, such as forces, torques, pressures, electromyographic signals, and energy metabolism. This solution typically integrates force platforms, inertial measurement units, high-speed motion capture systems, surface electromyography, and pressure distribution sensors, and utilizes specialized software for multi-source data synchronization and modeling analysis. Its primary applications include technical optimization in competitive sports, sports equipment development, clinical gait analysis and rehabilitation assessment, ergonomic design, and cutting-edge academic research. Its ultimate goal is to understand how force drives and influences human movement, achieving a leap from phenomenological description to understanding the underlying mechanical mechanisms.
