The global Biomedical Exoskeletons market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Robotic exoskeletons are wearable electromechanical devices that have been developed as augmentative devices to enhance the physical performance of the wearer or as orthotic devices for gait rehabilitation or locomotion assistance. These enable users with appropriate physical abilities to stand, walk, climb stairs and perform ADL. Biomedical exoskeletons are designed for rehabilitation or motion assistance purposes. Exoskeletons can be driven in many ways, but most commonly they are electrically, mechanically, or hydraulically driven. The motors, sensors, and servo drives in the exoskeleton act as components of the human body. The nervous system, or in this case the servo drives, instruct the motors to move as the human brain does with muscles. The encoders monitor and respond to the motion.

United States market for Biomedical Exoskeletons is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
