Membrane separation technology is a simple, efficient, energy-saving, and easily scalable separation technique with minimal pollution. In the process of drug separation and purification, it does not produce phase change issues and has a low incidence of secondary pollution, making it widely applicable in the biopharmaceutical field. Among the various membrane separation technologies, microfiltration, ultrafiltration, and reverse osmosis have become primary techniques in the medical and pharmaceutical industries. Microfiltration can remove macromolecules or solid particle impurities from extraction solutions; ultrafiltration can reduce nucleic acids, polysaccharides, proteins, and other impurities; nanofiltration can desalinate and concentrate extraction solutions to obtain enriched oligosaccharides.

The global Biomedical Membrane Materials market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
