Biomedical Monodisperse Microspheres refers to a small spherical material applied in the field of biomedical science. These microspheres have a very uniform size distribution and are commonly used in drug delivery, biological analysis, and the preparation of diagnostic reagents. They are usually made of different types of materials, such as polymers, metals, or silicone, and the specific material selection depends on the needs of their application. These microspheres can range in size from a few micrometers to tens of micrometers, and their uniform size distribution helps improve the accuracy of drug delivery and biological analysis.
