Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

According to this study, the global Biometric Point-of-Sale Terminals market size will reach US\$ million by 2030.

Biometrics technology is used for identification and authentication of people with the help of their biological and behavioral characteristics. An employee is asked for his user ID as soon as he logs into the retail PoS system. However, without typing in his password, he can simply scan his finger on the biometric fingerprint reader. Every time an employee tries to access a password-protected area, he is required to scan his finger. This leads to increased accountability, which ensures protection from accidental and intentional damage to the company's data

Based on technology, fingerprint identification, iris-retina scan recognition, palm-vein identification, iris recognition, voice recognition, and facial recognition are the segments of the global market for biometric point-of-sale terminals. Of these, fingerprint identification has been dominating the market. The prominence of this segment can be attributed to the convenience, ease of access, and high accuracy offered by this technology.
