The global Biomining market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Biomining is a sustainable and innovative process that utilizes microorganisms to extract valuable metals and minerals from ores and waste materials. This biotechnological method leverages the natural metabolic activities of bacteria, fungi, and archaea to dissolve and mobilize metals like copper, gold, and rare earth elements from mineral deposits, often in a more environmentally friendly manner compared to traditional mining techniques. Biomining can be applied to both primary ores and secondary resources, such as mine tailings, helping to reduce waste and lower the environmental impact of mining activities. By harnessing biological processes, biomining contributes to resource recovery and environmental remediation, offering a greener alternative in the mining industry.
