Biopelleting Energy is a technology that uses biomass materials (such as wood chips, straw, hemp stalks, etc.) to produce biomass pellet fuels for energy production. This technology can be used for heat production (such as boilers, hot blast stoves, etc.) or for power generation (such as gas turbines, steam turbines, etc.). The advantages of Biopelleting Energy technology are that it can use a large amount of waste materials for energy production, and the emissions of gases such as carbon dioxide from the combustion of biomass pellet fuels are lower than those from traditional fossil fuels. In addition, biomass pellet fuels are relatively low in price, which can effectively reduce energy costs.
