Conventional implants were used by orthopedic surgeons previously to fix internal fixation for years. These implants have required a lot of development over the decades. Regardless it's wide spread use, there are some problems associated with conventional implants which include the potential for long term relocation, stress shielding, breakage, reaction of the material, interference with the imaging devices and restricted growth in young patients. Recently, many bioresorbable implants have been made available as a feasible alternative to various indications. These bioresorbable implants dissolve in the human body and then get replaced by the natural bones. The implants which are somewhat large, interconnecting porous assembly is needed so that it can be integrated with the implant for better vascularization. By the additive manufacturing technology, this interconnecting porous structure can be manufactured directly.
