The global Biphasic External Defibrillator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A biphasic external defibrillator is a medical device used to treat cardiac arrest or arrhythmia. Unlike traditional monophasic defibrillators, biphasic external defibrillators deliver electrical current through the heart in both directions (i.e., positive and negative) at the time of shock to more effectively restore normal heart rhythm. Biphasic external defibrillators are usually used in the emergency treatment of patients with sudden cardiac arrest or severe arrhythmias. They can deliver electrical energy to the heart through electrodes attached to the patient's chest to restart the heart and restore its normal rhythm. In addition, biphasic external defibrillators can also be used to prevent the occurrence of cardiac arrhythmias, for example, during heart surgery or the treatment of certain diseases.
