A bipolar coagulation device is an electrosurgical unit used for the coagulation of blood vessels during surgery. One of the most common applications of bipolar coagulation device is in female sterilization through laparoscopy. bipolar coagulation devices are also popularly used in tumor removal procedures, since they provide more control and flexibility during surgery. A bipolar coagulation device uses lower voltages, thus, less energy is required. Although, the amount of energy used is a low bipolar coagulation device is able to give similar results to that of monopolar units, thereby making bipolar coagulation devices more desirable during surgery. Since the current in a bipolar coagulation device is restricted to the tissue between the two arms of the electrode, it gives better control and prevents damage to other sensitive areas, i.e. bipolar coagulation devices reduce the risk of burns in patients.
