Drug therapy is currently the core method of treating bipolar disorder, that is, the use of emotional stabilizers to adjust the patient's mood. Bipolar disorder is complex and difficult to control. The drug effect of emotional stabilizers can help patients to suppress their emotions when they are too high, to increase their emotions when they are depressed, to stabilize their emotions at a normal level, and to effectively prevent the recurrence of bipolar disorder. The quickest and most effective approach may be convulsive-free electroconvulsive therapy.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022. The pharmaceutical market factors such as increasing demand for healthcare, technological advancements, and the rising prevalence of chronic diseases, increase in funding from private & government organizations for development of pharmaceutical manufacturing segments and rise in R&D activities for drugs. However, the industry also faces challenges such as stringent regulations, high costs of research and development, and patent expirations. Companies need to continuously innovate and adapt to these challenges to stay competitive in the market and ensure their products reach patients in need. Additionally, the COVID-19 pandemic has highlighted the importance of vaccine development and supply chain management, further emphasizing the need for pharmaceutical companies to be agile and responsive

to emerging public health needs.
