The global Bipolar Electrosurgery market size is predicted to grow from US$ 741 million in 2025 to US$ 1103 million in 2031; it is expected to grow at a CAGR of 6.8% from 2025 to 2031.

Electrosurgery is a minimally invasive surgical procedure in which radiofrequency (RF) alternating current is used to increase intracellular temperature. Increase in the tissue temperature leads to cell desiccation or vaporization. This results into cutting or coagulation of tissue. Electrodessication is primarily used to block lumen-containing structures, or to remove big unwanted tissue such as soft tissue neoplasms. Protein coagulation is done to achieve hemostasis as well.

According to our research, the global market for medical devices is estimated at US$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment.
