A Bipolar Hall Sensor is a type of sensor that detects the presence of magnetic fields and translates this information into an electrical signal. It operates based on the Hall effect, where a voltage is generated at a right angle to the direction of current flow and the magnetic field. A Bipolar Hall Sensor can detect both positive and negative magnetic fields, making it useful for applications that require directional detection or sensing of changes in magnetic field strength. It is commonly used in devices like joysticks, mice, and other input devices that require positional feedback.

The global Bipolar Hall Sensor market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
