Birth control implants are devices that are highly effective in preventing pregnancy for a short period. These implants are placed sub-dermally and contain progestin, release of which stops ovulation. It also leads to thickening of the vaginal fluid that avoids fertilization by preventing sperms from reaching the egg. It also causes thinning of uterine lining that makes it difficult for the fertilised egg to attach onto it. Birth control implants are reversible contraceptive birth controls and have very low failure rate and if properly placed are able to avoid pregnancy for three years.
