The global Bispecific Antibodies for Solid Tumor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Bispecific antibodies for solid tumors refer to a type of therapeutic antibody that is designed to recognize and bind two different targets on the surface of cancer cells. This approach is particularly relevant for solid tumors, which are often resistant to traditional single-target therapies. By having two different targets, bispecific antibodies are able to simultaneously engage both cancer cells and surrounding immune cells, triggering an immune response against the tumor. This dual-targeting approach can help to overcome some of the mechanisms that solid tumors use to evade immune detection, such as by downregulating expression of single target antigens or upregulating checkpoint regulators. Bispecific antibodies can also be designed to promote direct cell killing of cancer cells through recruitment and activation of immune cells, such as T-cells and Natural Killer (NK) cells. This mechanism of action can help to overcome resistance to cell death induced by single-target therapies. Recent advances in the development of bispecific antibodies have led to the availability of several FDA-approved molecules for the treatment of solid tumors, such as Catumaxomab for malignant ascites in ovarian cancer and Blinatumamab for certain types of leukemia. Many more bispecific antibodies are currently being evaluated in clinical trials for solid tumors, and are expected to have a significant impact on the treatment of cancer in the future.
