The global Bisphenol A (BPA) for Polycarbonate market size is predicted to grow from US\$ 6022 million in 2025 to US\$ 9075 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

Bisphenol A (BPA) is an organic chemical compound with the molecular formula $C_{15}H_{16}O_2$. It is a key raw material used in the production of polycarbonate (PC) and epoxy resins. BPA consists of two phenol molecules connected by a propane group, and is widely used in the manufacturing of polycarbonate plastics, electronic housings, beverage bottles, and other products. In 2025, Global Bisphenol A for Polycarbonate sales are estimated at 5,700 Kilotons, with an average ex-works price of around 1,080 US\$/Ton.

The Bisphenol A for polycarbonate value chain starts from benzene, propylene, cumene, phenol and acetone, moves through high-purity BPA production and purification, and then flows into phosgene or non-phosgene polycarbonate resin manufacturing for applications in electronics, automotive, optical, medical, construction and consumer products.

Demand for BPA used in polycarbonate is mainly driven by the upgrading of engineering plastics, lightweight automotive materials, electrical and electronic applications, optical and medical transparent materials, and integrated PC value-chain expansion in Asia. Polycarbonate remains difficult to replace in applications such as automotive headlamps, electronic housings, connectors, optical lenses, medical-device housings and construction sheets because of its transparency, impact resistance, heat resistance, electrical insulation and dimensional stability. At the same time, new PC capacity in China, Korea and Southeast Asia supports captive and merchant BPA

demand through integrated phenol/acetone/BPA/PC chains. However, tighter BPA-related regulation in food-contact and sensitive consumer applications in Europe and North America limits some low-end growth, pushing demand toward industrial, electronics, automotive, medical and higher-performance uses.
