A bitter taste blocker refers to a substance or compound that inhibits or masks the perception of bitterness in food and beverages. Bitterness is one of the basic tastes detected by taste receptors on the tongue, and it often serves as a warning signal for potentially harmful substances. However, in certain cases, the bitterness of certain ingredients or compounds may be undesirable, leading to the use of bitter taste blockers to enhance the overall flavor profile. Bitter taste blockers work by either interfering with the bitter taste receptors on the tongue or by altering the chemical structure of the bitter compounds themselves. They can effectively reduce or eliminate the perception of bitterness, allowing other tastes, such as sweetness or umami, to dominate.

The global Bitter Taste Blocker market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
