The global Black and White Polarizer market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The full name of polarizing film is polarizing film. The imaging of liquid crystal displays must rely on polarized light. All liquid crystals have two polarizing films tightly attached to the liquid crystal glass, forming a liquid crystal film with a total thickness of about 1mm. If any polarizer is missing, the LCD panel cannot display images. The reason why polarizing film is called polarizing film is because the polarizing film facing the eyes of ordinary LCD displays is frosted to dissipate surface reflections and scatter light to increase the viewing angle of the LCD display. Polarizing film products are divided into two categories according to their application fields: Tft LCD series polarizing film and black and white series (TN STN OLED) polarizing film. The former is mainly used for color TFT LCD displays, while the latter is mainly used for monochrome and false color LCD displays, as well as 3D goggles and polarized sunglasses (anti glare and anti UV). The main difference between the two is the different performance requirements for polarizing films. Black and white polarizing films include TN and STN, while color polarizing films are divided into two technical routes: TFT-LCD and AMOLED. Currently, LCD is the main industry, and as OLED panels continue to penetrate into large-sized products such as televisions, OLED is the main development trend in the future. However, there is still a small amount of production capacity for black and white polarizing films in China, and their applications and demand are relatively small.

United States market for Black and White Polarizer is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
