The global Blank Mask (Photomask Substrates) market size is predicted to grow from US\$ 1688 million in 2025 to US\$ 3113 million in 2032; it is expected to grow at a CAGR of 9.4% from 2026 to 2032.

Blank mask, also known as photomask substrate, is a core raw material in the upstream photolithography process of microelectronics manufacturing. As the base material for making photomasks, it is composed of a precision-polished high-purity substrate and functional thin films such as nanoscale light-shielding films and photoresist layers deposited on it. It itself does not contain any circuit patterns. After exposure and etching processes, it can be processed into photomasks with specific patterns. The flatness of the substrate and the uniformity of the film layers directly determine the accuracy of the photolithographic pattern transfer, thus affecting the process yield and performance of end products such as semiconductors and flat panel displays.

In 2025, global Blank Mask (Photomask Substrates) sales reached approximately 57,093 Sqms, with an average global market price of around 30,220 US\$/Sq. Production capacity reached 65,000 Sqms, with a gross profit margin of approximately 35%.
