Block Copolymer Electrolytes are a class of solid polymer electrolytes formed by linking two or more distinct polymer segments (blocks) in a linear sequence. These blocks are chemically different and typically exhibit phase separation on the nanoscale, leading to well-organized microstructures such as lamellae, cylinders, or gyroids. One block usually provides mechanical strength (e.g., polystyrene), while the other offers ionic conductivity (e.g., polyethylene oxide or PEO). The phase-separated morphology allows for a balance of mechanical robustness and ion transport efficiency, making block copolymer electrolytes promising candidates for lithium-ion and next-generation solid-state batteries. Their tunability via block length, composition, and architecture enables precise control over ionic conductivity, mechanical integrity, and thermal stability.

United States market for Block Copolymer Electrolytes is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
