Abstracts

The global Blockchain AI market size is predicted to grow from US\$ 704 million in 2025 to US\$ 3512 million in 2032; it is expected to grow at a CAGR of 25.9% from 2026 to 2032.

Blockchain AI refers to applying machine learning, graph analytics, and generative/agentive AI to blockchain and crypto ecosystems to detect, predict, and automate decisions on on-chain transactions and address graphs, smart-contract code and runtime events, as well as market and fund-flow signals—thereby improving security, compliance, and operational efficiency. Delivered primarily as software and services, a typical architecture includes on-chain data ingestion and indexing (nodes/RPC, indexers, labeling and entity clustering), feature engineering and model training/inference, signal delivery via APIs/SDKs plus dashboards and case management, and enforcement/governance components (alert orchestration, policy constraints, audit logs, optionally backed by TEEs or zero-knowledge style verification). Key applications span smart-contract auditing and runtime monitoring, AML/KYT and transaction risk scoring, fraud and attack detection, and market intelligence with controlled automation for trading and asset management; major supply hubs commonly include the United States, the UK/Europe, Singapore, and China.

Blockchain AI is moving from ad hoc analytics into a production grade capability layer, propelled by three structural forces. First, on chain assets and transaction pathways are becoming more complex, while hacks, fraud, and cross chain spillovers raise the cost of inaction, turning monitoring, smart contract security, and real time risk control into mandatory spend for institutions. Second, compliance requirements are tightening across major markets, pushing transaction monitoring and risk scoring beyond rule engines toward model driven systems that continuously learn, expand coverage, and

reduce false positives. Third, large models and agentic workflows lower the barrier to interpretation and response, enabling alert triage, case orchestration, and controlled execution to form closed loops, increasing subscription penetration and accelerating standard modules for exchanges, custodians, payment rails, and stablecoin operations.

At the same time, commercialization hinges on engineering readiness across trust, control, and auditability. On chain data is noisy, adversarial, and fast evolving, making model drift, scarce labels, and evasion tactics key drivers of lifecycle cost. Institutional buyers have low tolerance for false positives and missed detections, and demand explainability, end to end evidence trails, and jurisdiction aware data governance, forcing vendors to invest as much in data governance, traceable logs, and operational workflows as in algorithms. A second risk is tail events in automation, where agents or strategies can amplify losses under extreme volatility or network congestion, so permissioning, limits, circuit breakers, and human in the loop controls are becoming default product requirements, while trusted execution and verifiable computation are advancing from concepts into early commercial pilots.

Downstream demand is converging on platformization and multi chain coverage. Exchanges and custodians are shifting risk management upstream into onboarding and full trade lifecycle controls, prioritizing API first integration and case management, and expanding from single chain to multi chain and cross chain routes. DeFi and Web3 protocol teams increasingly focus on runtime monitoring, exploit early warning, and automated incident response to compress the time from detection to containment and reduce cascading losses. Enterprise and consortium chain users prefer auditable and explainable intelligence for risk control and data governance in supply chain finance, tokenized assets, and compliance reporting. Overall, competition is moving from point tools to integrated platforms, and vendors that combine data, models, workflows, and trust mechanisms are best positioned to secure longer contracts and higher value per deployment.
