The global Blockchain Technology in Aerospace market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

Blockchain, a digital ledger of transactions taking place in a peer-to-peer network, can record each time a part is installed or removed from an airplane. It can also capture how long the part being replaced was in service and the identity, location and credentials of the technician performing the repair.

It's like having a digital 'birth certificate' for every part, updated every time the plane is serviced or inspected. These birth certificates can be aggregated into a 'digital twin' of the aircraft that provides a real-time snapshot of its condition from the moment it exits the assembly line to when it is returned to its lessor or retired from the fleet.

Having a more accurate view of a plane's configuration and maintenance history could help reduce costs and losses related to downtime and unplanned maintenance, boost the value of planes in the secondary market and at the end of leases, and improve worker productivity.

Blockchain technology has broad application prospects in the aerospace field. Through blockchain technology, the efficiency and transparency of aviation logistics management can be improved, the convenience of ticket sales and passenger security checks can be promoted, and the supervision and management of drones can be strengthened. In order to achieve these goals, we need to continuously explore the

application scenarios and solutions of blockchain technology. At the same time, the government, enterprises and academia need to work together to promote the research and development of related technologies.
