Blood cell separation membrane is a specialized filtration device used to isolate specific blood components, such as red blood cells, white blood cells, or platelets. This membrane utilizes selective permeability to allow certain cells to pass through while retaining others, facilitating efficient processing of blood samples. It is commonly used in clinical laboratories for diagnostics, research, and transfusion medicine. The design of the membrane is optimized for high flow rates and minimal cell damage. This technology enhances the accuracy and reliability of blood analysis.

The global Blood Cell Separation Membrane market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
