Blood coagulation or clotting is the process by which blood changes from liquid to gel, thus, forming clots. These clots result in cessation of bleeding. However, the process of coagulation is hindered in the people suffering from liver disease, thrombophilia, and hemophilia. Various blood coagulation testing procedures are used for diagnosing these diseases, which provide the status of the hemostatic functioning of the patient. Haemostatic involves a coordinated series of interactions between platelets and numerous blood clotting proteins. With increasing prevalence of hemostatic diseases, the demand for blood coagulation testing has increased. To analyses the treatment efficiency against hemostatic diseases, the blood clotting testing is required.
