Blood - Grouping Reagent is a biological preparation used to detect the blood type of the human body, mainly based on the principle of antigen - antibody reaction. The reagent contains specific antibodies against blood - group antigens, such as anti - A antibody, anti - B antibody, anti - D antibody, etc. During blood - type identification, the reagent is mixed with the examinee's blood sample. By observing whether agglutination occurs, it is possible to determine the blood - group antigens present on the surface of the examinee's red blood cells, thereby determining their blood type in the ABO blood group system (such as type A, type B, type AB, type O) and the Rh blood group system (Rh - positive or Rh - negative), etc.

United States market for Blood-Grouping Reagent is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
