Blood proteolytic enzymes are a class of enzymes that can break down proteins in the blood and usually play an important physiological role in the body. They promote the degradation and conversion of proteins by hydrolyzing peptide bonds in proteins, helping to maintain the metabolic balance of proteins in the body. Blood proteolytic enzymes are widely used in the fields of biomedicine, food processing, etc., especially in the process of protein hydrolysis, which can improve the digestion and absorption rate of proteins or improve their nutritional value. Common blood proteolytic enzymes include trypsin, pepsin, etc.
