Blow Fill Seal (BFS) technology is an advanced manufacturing process used primarily in the pharmaceutical and food industries to create sterile liquid-filled containers. This technology involves three main steps: blowing, filling, and sealing. Initially, a thermoplastic polymer is extruded and formed into a container using blow molding. The formed container is then immediately filled with the product while still within the sterile environment. Finally, the container is sealed, all in one continuous and automated process. BFS technology is known for its efficiency, cost-effectiveness, and ability to maintain high standards of sterility, making it ideal for producing unit-dose medications, injectable drugs, and other aseptic liquid products.
