The blower is the core component of the powered air-purifying respirator. It is powered by a battery and uses a motor to drive the fan to draw in ambient air and force it through the filter. After purification, it is delivered to the user's hood, mask or helmet to provide clean breathing air. Its functions include reducing breathing resistance, maintaining a positive pressure environment (to prevent pollutants from penetrating), and supporting long-term operations.

The development of blowers for Powered Air Purifying Respirators (PAPRs) is advancing rapidly, driven by technological innovation, evolving safety standards, and increasing demand across industries such as healthcare, construction, and hazardous material handling. One key trend is the integration of smart technologies, where blowers are now being equipped with IoT-enabled sensors to monitor real-time airflow, filter efficiency, and battery life, transmitting data to mobile devices or central systems for proactive maintenance and compliance tracking. Additionally, energy efficiency improvements are a major focus, with manufacturers developing longer-lasting, fast-charging lithium-ion batteries and even exploring solar-powered or kinetic energy-harvesting options to extend operational time in remote or resource-limited settings. Another significant advancement is the miniaturization and lightweight design of blower
