Blower Coil Units consist of a coil (either for heating or cooling), a fan, and a housing. These units are designed to handle both the heating and cooling aspects of HVAC systems. The coil is responsible for either heating or cooling the air as it passes through, and the fan circulates the conditioned air into the building space. Blower coil units are typically equipped with controls that allow for precise temperature regulation. These controls can be integrated into the building's overall HVAC system and can be adjusted based on temperature settings and occupancy requirements. Blower coil units are commonly found in various building types, including commercial offices, hotels, residential buildings, hospitals, and industrial facilities. They are often used in locations where individual zone control and high-efficiency heating and cooling are required.
