The global Blue Green Algae Sensors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The cyanobacteria sensor uses the absorption and emission peaks of cyanobacteria in the spectrum to emit monochromatic light of a specific wavelength to the water body. After the cyanobacteria in the water absorb the energy of this monochromatic light, they release monochromatic light of another wavelength. The light intensity emitted by the cyanobacteria is proportional to the content of cyanobacteria in the water. By measuring the target parameters based on the fluorescence of the pigment, it is possible to identify algal blooms before they affect the environment.

United States market for Blue Green Algae Sensors is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
