The Blue Light Transilluminator is an imaging device based on a specific wavelength blue light source that excites nucleic acid dyes (e.g., GelRed, SYBR Safe) or fluorescent proteins to visualize nucleic acid bands in agarose or polyacrylamide gels. Its core design includes a high-intensity LED light source array, filter modules, and a uniform light field regulation system, serving as an alternative to traditional UV transilluminators to reduce DNA photodamage risks while supporting visible-light-excitabile fluorescent markers. It offers advantages in safety, clear imaging, and absence of background autofluorescence interference.
