BMC firmware runs on BMC hardware, including a series of software stacks such as BMC hardware boot program, kernel, driver, file system, IPMI application, web service, etc. It is responsible for providing various interfaces and services required by the BMC system, realizing the centralized operation management and monitoring of server equipment, fault warning/alarm, health status monitoring, system deployment and configuration, etc. When the server has abnormal operation, software and hardware failure, or even downtime, the BMC system can still alarm, manage, control, and recover from the failure of the server equipment, which plays a vital role in the use management and maintenance of the server system, and has extremely high management authority over the server equipment. BMC firmware is one of the core basic software in the server system industry chain.

The global BMC Firmware market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
