A board terminal block is a component designed for installation on a printed circuit board (PCB) and for electrical connection to other boards or components via wires or cables.

There are various methods to connect a board terminal block to wires and cables. For example, some types use screws to fasten wires via crimp terminals attached to the wire ends. Others incorporate a spring in each terminal of the block, allowing wires to be fastened by inserting them while pressing down on specific parts of the terminal.

In both types, soldering to connect wires or cables to the board terminal block is not necessary, enabling use by individuals without soldering expertise.

The global Board Terminal Block market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
