The body fat scale is a weighing scale that can measure fat, moisture, etc. in addition to measuring body weight. At present, there are sensors for measuring the body fat of the materials of the Ito film and the electrode sheet.

The principle of the body fat scale is that the muscle contains more blood and other water, which can conduct electricity, and the fat is not conductive. Because the channel conductor of the current in the body is muscle, the weight of the muscle can be known from the difficulty of passing the current, and thus the ratio of the body weight can be judged.
