The working principle of the BOG compressor is to use the connecting rod to push the piston to repeat the movement, so that the gas is boosted and transported out. BOG, or Boil Off Gas, refers to low-temperature liquid, such as LNG (-162?), low-temperature propane (-40?-42?), low-temperature butane (0?-2?), etc., volatilizing after absorbing external heat Gas. With the increase of volatile gas in the storage tank, the pressure in the storage tank continues to rise. In order to maintain the storage tank pressure within the allowable range, it is generally necessary to compress and condense the BOG into a liquid or output after compression. The BOG compressor is a compressor for compressing BOG. General BOG compressors use oil-free lubricating reciprocating compressors, the working principle is the same as ordinary reciprocating compressors. The difference is that the inlet of the BOG compressor sucks low-temperature gas. Therefore, the first-stage cylinder and piston of the compressor must be resistant to low temperature and prevent freezing. Oil-free lubrication is generally achieved with labyrinth seals or special piston rings.
