The report requires updating with new data and is sent in 48 hours after order is placed.

Gasified LNG by inevitable heat input from external area is referred to as boil off gas (BOG). BOG is conventionally pressurized with compressor and then sent as city gas or fuel for power generation together with LNG gas vaporized by heat exchanger. BOG re-liquefaction technology using LNG cold energy has been established as one of other gas treatment methods. In case of gas supposed to be sent as city gas or fuel for power generation, gas pressure reaches 30 to 90 barG while pressure of BOG going to re-liquefaction facility is lower than 10 barG. Therefore, addition of re-liquefaction facility decreases the size of BOG compressor to reduce operational power, which leads to energy conservation
