Abstracts

The global Bolt Carriers market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The bolt carrier group performs all these tasks by harnessing the gas produced by the round being fired. A gas tube connects a gas port on the barrel to the gas /carrier key atop the BCG. This key forces all that high-velocity gas into the body of the BCG. When this happens, the BCG unlocks and drives backward into the buffer tube, compressing the buffer and buffer spring. The compressed buffer spring re-expands rapidly, driving the BCG back into the upper receiver.

The use of coatings and treatments to enhance the corrosion resistance, wear resistance, lubricity, and aesthetics of Bolt Carriers. Some examples of coatings and treatments are nickel boron, titanium nitride, black nitride, and chrome. The use of lightweight materials to reduce the weight and recoil of Bolt Carriers. Some examples of lightweight materials are aluminum, titanium, and carbon fiber. The use of adjustable gas systems to regulate the gas flow and pressure to the Bolt Carriers. This can allow the user to fine-tune the cycling speed and force of the Bolt Carriers according to the ammunition type, environmental conditions, and personal preference. The use of modular designs to enable the interchangeability and compatibility of Bolt Carriers with different calibers, platforms, and accessories. This can increase the versatility and customization of firearms.
