The global Bonded Magnets for Brushless Motors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Bonded magnet for brushless motors is a permanent magnet material used for brushless motor rotors. It is made by mixing, pressing and solidifying magnetic powder and binder through powder metallurgy technology. Its advantage is that it can be made into various complex shapes, such as cylindrical, ring, sector, etc., and is suitable for the design of inner rotor or outer rotor brushless motors. Its disadvantages are low magnetism, poor temperature resistance, and susceptibility to humidity and corrosion. Commonly used materials for bonded magnets used in brushless motors include ferrite, neodymium iron boron, samarium cobalt, etc. Among them, neodymium iron boron bonded magnets have the highest magnetic energy product, but they are also the easiest to demagnetize and require special protection measures. Samarium cobalt bonded magnets have the highest temperature resistance, but are also the most expensive. Ferrite bonded magnets have the lowest cost, but are also the least magnetic. There are many bonding methods for bonded magnets for brushless motors, such as glue bonding, mechanical snapping, magnetic adsorption, etc. Different methods have different advantages and disadvantages, and they need to be selected according to the structure, performance, working conditions and other factors of the motor. Generally speaking, glue bonding requires the use of high-temperature, high-strength glue to ensure that it can withstand the influence of magnetic fields and mechanical forces during operation. Commonly used glues include epoxy resin, polyurethane, cyanoacrylate, etc.
