Bone block fixation set is the orthopedic toll used for the regeneration of bone in the oral cavity to stabilize and fix the bone graft. Bone block fixation set is a dedicated surgical instrument with the entire set of the screw. The screw of bone block fixation set is designed in such way that it can be used with the substitute material. The bone block fixation set consist of a variety of screws with different sizes and shapes. The square shape screw is inserted to maximize the torque whereas the wider head screws are inserted to lower down the concentration of stress load. Sometimes, due to the insufficient bone volume at the desired implant site, bone fixation is required. This type of bone fixation is performed by the bone block fixation set. Bones are fixed with the simple and more reliable techniques by using bone block fixation sets. Bone block fixation set enables the placement of implant where formerly insertion of an implant was not applicable. If the bone defect is too extensive, then bone substitute material and barrier membrane are combined with the bone block fixation sets.
