The global Bone Conduction Audiometer market size is predicted to grow from US\$ 9511 million in 2025 to US\$ 13830 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

A bone conduction audiometer is a special hearing aid that helps people improve their hearing by conducting sound through the skull bone to the inner ear, rather than through the traditional cochlea. This technology can help people who are unable to use regular hearing devices due to things like cochlear problems or blockage in the external ear canal. As technology develops, bone conduction audiometers will gradually shrink in size and weight, making them more comfortable and portable.
