## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Bone conduction open Bluetooth headphones are an innovative audio device that transmits sound to the wearer's inner ear through bone conduction technology without the need to cover or insert into the ear canal. Unlike traditional earphones, the vibration unit of this earphone is close to the temporal bone, vibrating the bone to transmit sound, thereby keeping the ear canal open. The benefits of this design include improving the perception of ambient sounds, ensuring that you can still hear surrounding sounds while listening to music or answering calls, and increasing safety during outdoor activities. This type of headset usually uses wireless Bluetooth connection, providing a convenient pairing and use experience, and reducing pressure and discomfort on the ears because it does not need to be plugged into the ear canal. It is very suitable for athletes, cyclists, and users who need to wear headphones for long periods of time. Its open-ear canal design also helps reduce the risk of ear canal infections while keeping ears ventilated and clean.
