The research report highlights the growth potential of the global Bone Growth Stimulators market. Bone Growth Stimulators are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Bone Growth Stimulators. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Bone Growth Stimulators market.

Bone growth stimulators are used in cases of delay or failure of fracture healing as they enhance the bone-healing process without the sensation of electrical shocks or currents or vibrations when worn by the user. An internal bone growth stimulator or invasive bone growth stimulator is implanted on the fusion site of the bone and it delivers small electrical currents. The internal bone growth stimulator is removed from the body after 6–12 months. External bone growth stimulator or non-invasive bone growth stimulators are portable devices worn externally and do not require surgical implantation. An external bone growth stimulator is prescribed for use for two to nine hours every day for around three to nine months.

Economic factors such as improvement in service sector, increase in personal income

and increase in per capita healthcare expenditure are expected to drive market growth globally. However, various factors such as availability of alternative therapies, uncertainty about efficacy, device-related issues and competition from bone grafts restraint growth of the bone growth stimulators market.
