Abstracts

The global Bone Marrow Biopsy Needle market size is predicted to grow from US\$ 82.43 million in 2025 to US\$ 106 million in 2032; it is expected to grow at a CAGR of 3.6% from 2026 to 2032.

In 2025, global Bone Marrow Biopsy Needle production reached approximately 766 k units, the average price is 110 usd/unit. Bone Marrow Biopsy Needle is a specialized medical device used internationally for obtaining bone marrow tissue samples. It is usually composed of a cannula and a stylet with a cutting groove. It is used to penetrate the bone (most commonly in the posterior superior iliac spine), rotate and cut out a small strip of intact bone marrow. This procedure is used primarily for the diagnosis of various hematological disorders, myelofibrosis, metastatic cancer, lymphoma infiltration, and for the assessment of fever or cytopenia of unknown origin, and provides histopathological information that is an important complement to bone marrow aspirate smear examination.

Market Concentration and Key Players:

Internationally, the market concentration degree of bone marrow biopsy needle is relatively high, mainly concentrated in developed countries such as Europe and America. For example, BD, Zamar Care and other large manufacturers; from the domestic perspective, there is still a lot of room for development of bone marrow biopsy needle.

Manufacturing Processes and **Market Trends:**

The manufacturing process of the bone marrow biopsy needle takes precision

machining as the core. The needle body is usually manufactured by the composite process of medical stainless steel and polymer materials. The needle tip is designed in a triangular shape and the bevel angle is controlled between 12 and 15 degrees. The surface is polished at the nanometer level to reduce the friction coefficient. The length of the sampling slot is standardized to be 20±0.5 mm. The edge of the slot is cut by laser to form a micro-sawtooth structure to improve the tissue grasping rate. The matching tolerance between the taper of the front end of the stylet and the needle tube is strictly controlled within 0.02 mm to ensure that no tissue extrusion deformation occurs in the sampling process. Some designs also include external threads on the needle tip and graduations on the outside of the needle body to aid in penetration and depth control. The whole production process shall be carried out in a clean environment, and strict industry standards shall be implemented. The product shall be sterilized by ethylene oxide to ensure sterile safety.

The bone marrow biopsy needle market is growing steadily. Market growth is driven primarily by the increasing prevalence of blood disorders worldwide and technological advances in needle design, materials, etc. Future trends focus on minimally invasive, accurate, and possible integration of image-guided techniques to improve surgical safety and success.
